

# 2005 – Measuring BGP

---

March 2006

Geoff Huston  
Research Scientist  
APNIC

# Objectives

---

Look at the “whole” of the Internet for 2005 and attempt to understand the network’s characteristics in terms of “whole of network” metrics

Look at the behaviour of the Internet’s inter-domain routing system and attempt to understand the correlation of projections of router capacity and routing protocol load

# Methodology

---

- 2 data acquisition mechanisms:
  - Sequence of hourly dumps of the BGP RIB
    - “show ip bgp”
      - Shows prefixes, paths, and attributes at that time held by the target router
  - Update Log of BGP speaker
    - “log updates”
      - Shows timestamp and BGP Update packet log of every BGP message in all peer sessions

# IPv4 in 2005

## Total Advertised BGP Prefixes

# IPv4 in 2005

## Total Advertised Address Span

# IPv4 in 2005

## Total Advertised Address Span

## IPv4 in 2005

# Total Advertised AS Numbers

# IPv4 – Vital Statistics for 2005

---

Prefixes	148,500 – 175,400	+18%	26,900
Roots	72,600 – 85,500	+18%	12,900
Specifics	77,200 – 88,900	+18%	14,000
Addresses	80.6 – 88.9 (/8)	+10%	8.3 /8s
ASNs	18,600 – 21,300	+14%	2,600

Average advertisement size is getting smaller

Average address origination per AS is getting smaller

Average AS Path length steady at 3.5

AS interconnection degree up

The IPv4 network continues to get denser, with finer levels of advertisement granularity.

More interconnections, more specific advertisements

# IPv6 in 2005

## Advertised Prefix Count

---

# IPv6 in 2005

## Advertised Address Span

# IPv6 in 2005

## Advertised Address Span w/o 6Bone

## 6Bone Address Span

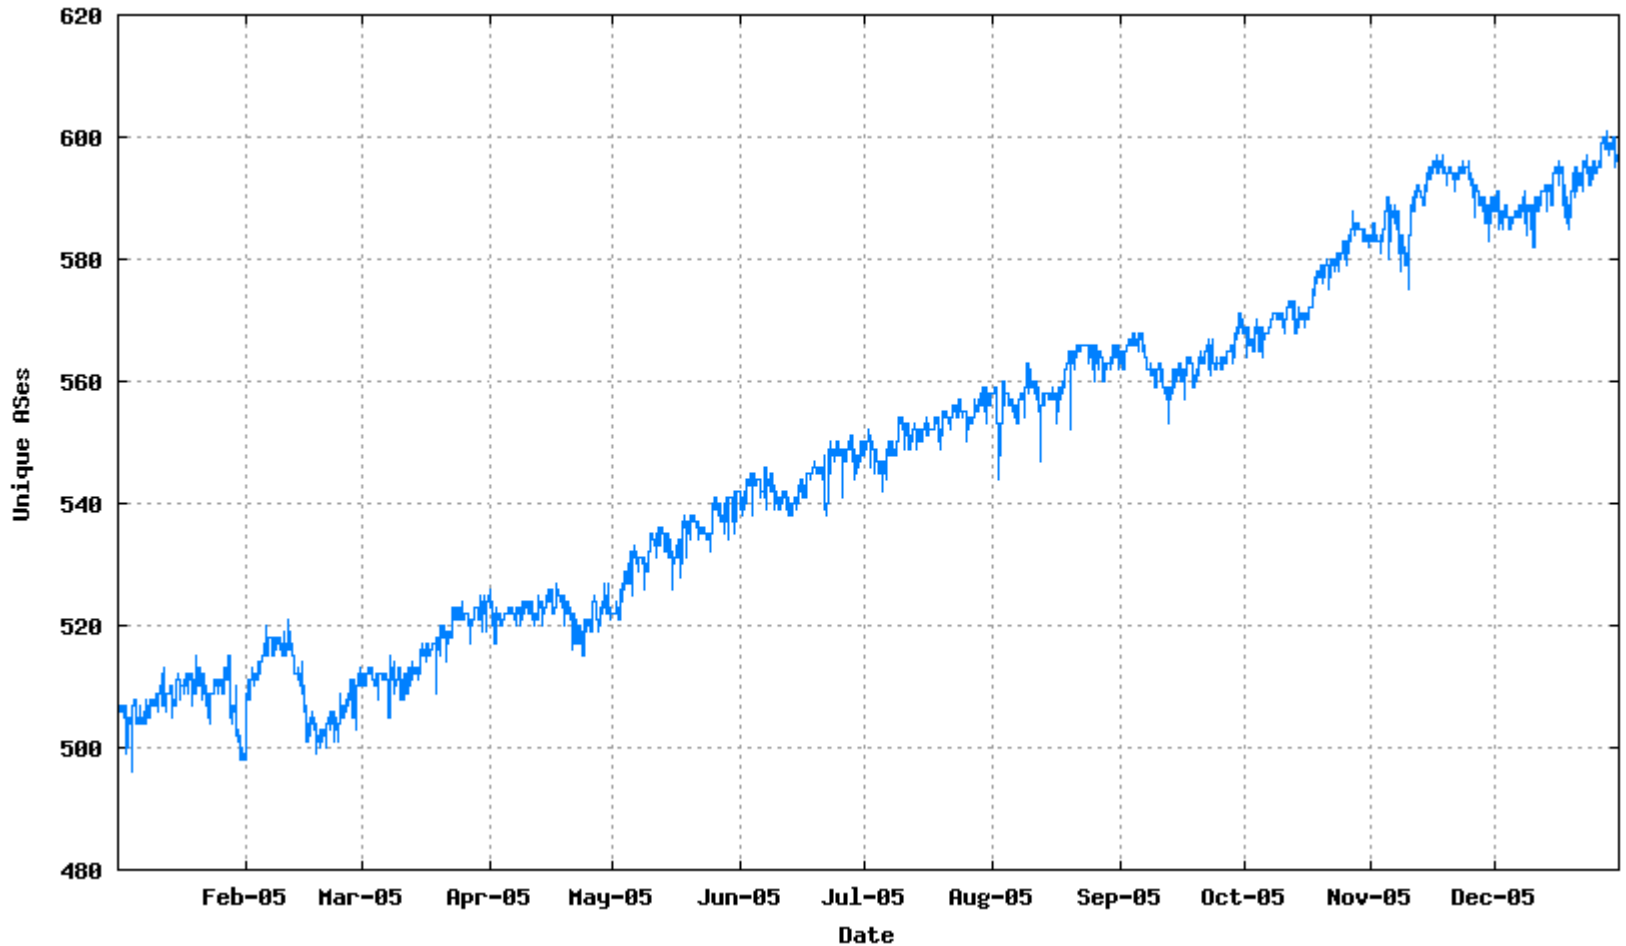

# IPv6 in 2005

## Combined View of Address Span

## IPv6 in 2005

# Total Advertised AS Numbers

# IPv6 – Vital Statistics for 2005

---

Prefixes	700 – 850	+21%
Roots	555 – 640	+15%
Specifics	145 - 210	+51%
Addresses	9 – 13.5 ( $10^{13}$ )	+50%
ASNs	500 – 600	+20%

Average advertisement size is getting larger

Average address origination per AS is getting larger

Average AS Path length variable between 3 – 5

AS interconnection degree variable

Through 2005 the IPv6 network remained small and continued to use a very large proportion of overlay tunnels at the edges. Larger scale trends in network characteristics were not readily discernable from 2005 figures

---

Vince Fuller's question:

If you were buying a large router suitable for use in a "DFZ" with an expected lifetime of 3-5 years, what would you specify as the number of IPv4/IPv6 prefixes it must be able to handle? And how many prefix updates per second?

personal communication, January 2006

# BGP Update Study - Methodology

---

- Examine update and withdrawal rates from BGP log records for 2005 from a viewpoint within AS1221
  - Eliminate local effects to filter out non-DFZ BGP updates
  - Look at the relative rate of updates and withdrawals against the table size
- Generate a BGP table size predictive model and use this to generate 3 – 5 year BGP size and update rate predictions

# Update Message Rate

---

# Prefixes per Update Message

---

Prefixes per BGP Update Message

# Update Trends across 2005

---

- Number of update messages per day has doubled across 2005 (Dec 2005 saw approx 550,000 update messages per day)
  - Considering the large population, the daily update rate is highly variable – why?
- Number of prefixes per update message is falling from an average of 2.4 to 2.3 prefixes per update
  - Is this attributable to increased use of public ASs and eBGP at the edge of the network? (Multi-homing?)
- Is the prefix update rate increasing at a greater rate than the number of prefixes in the routing table?
  - Is there some multiplicative factor at play here?
  - Why is instability increasing faster than the network size?

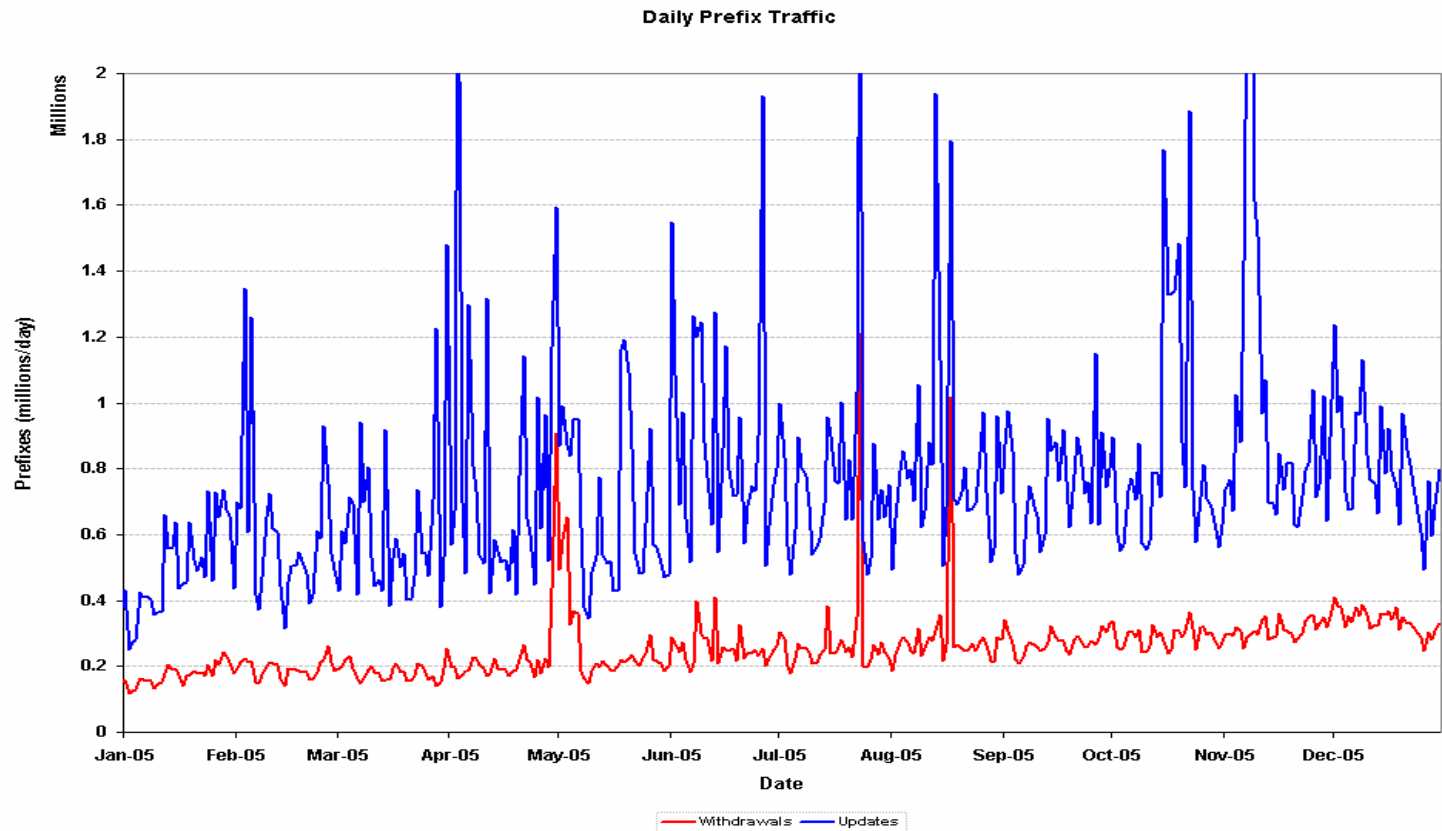

# Prefixes vs Updates

---

- Look at the number of prefixes that are the subject of update messages
- What are the trends of prefix update behaviour?

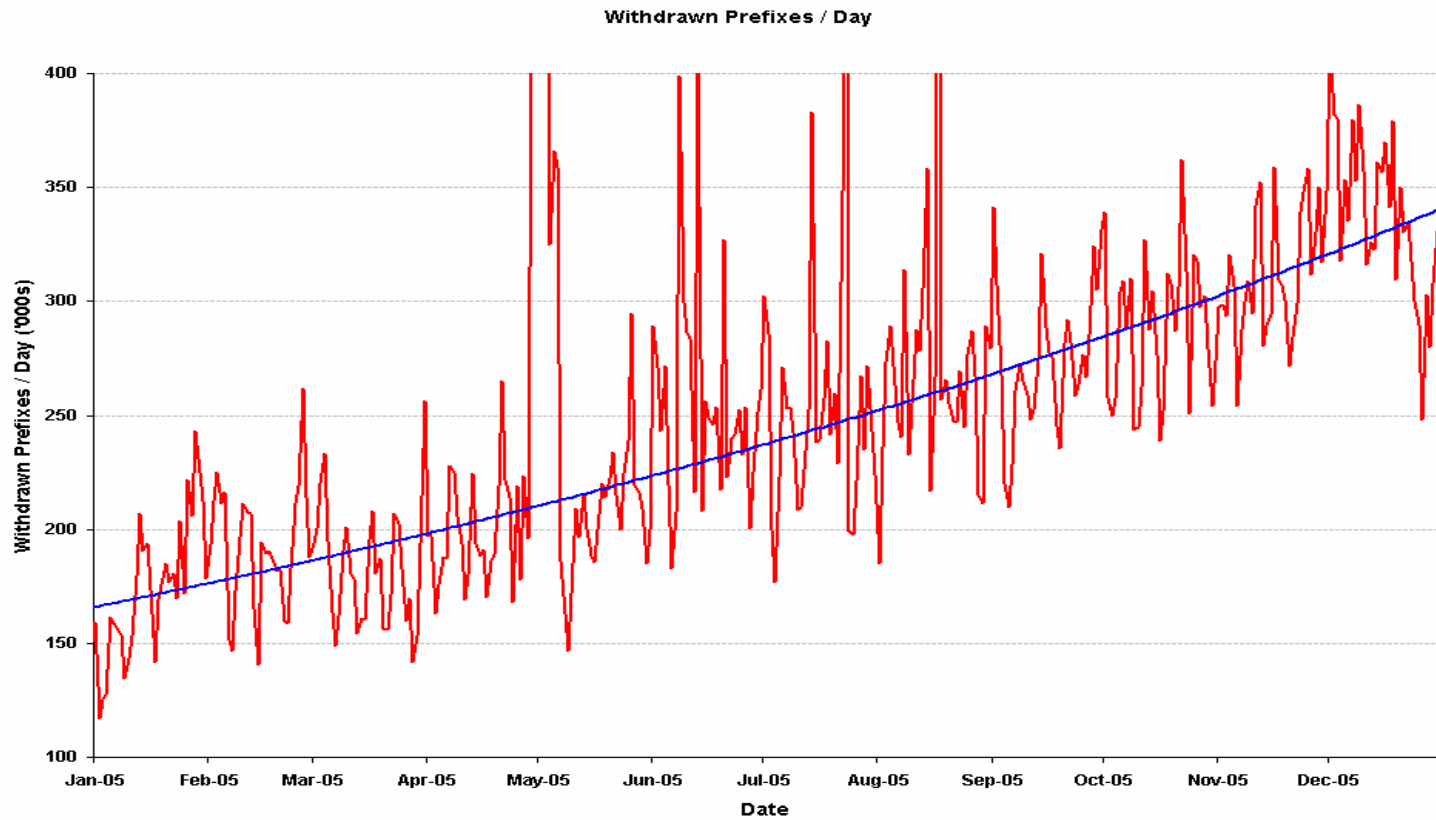

# Prefix Update and Withdrawal Rates

# Prefix Update Rates

# Withdrawal Rates

# Prefix Rate Trends

---

- High variability in day-to-day prefix change rates
- Best fit model appears to be exponential – although update and withdrawal rates show different growth rates

# BGP Prefix Table Size

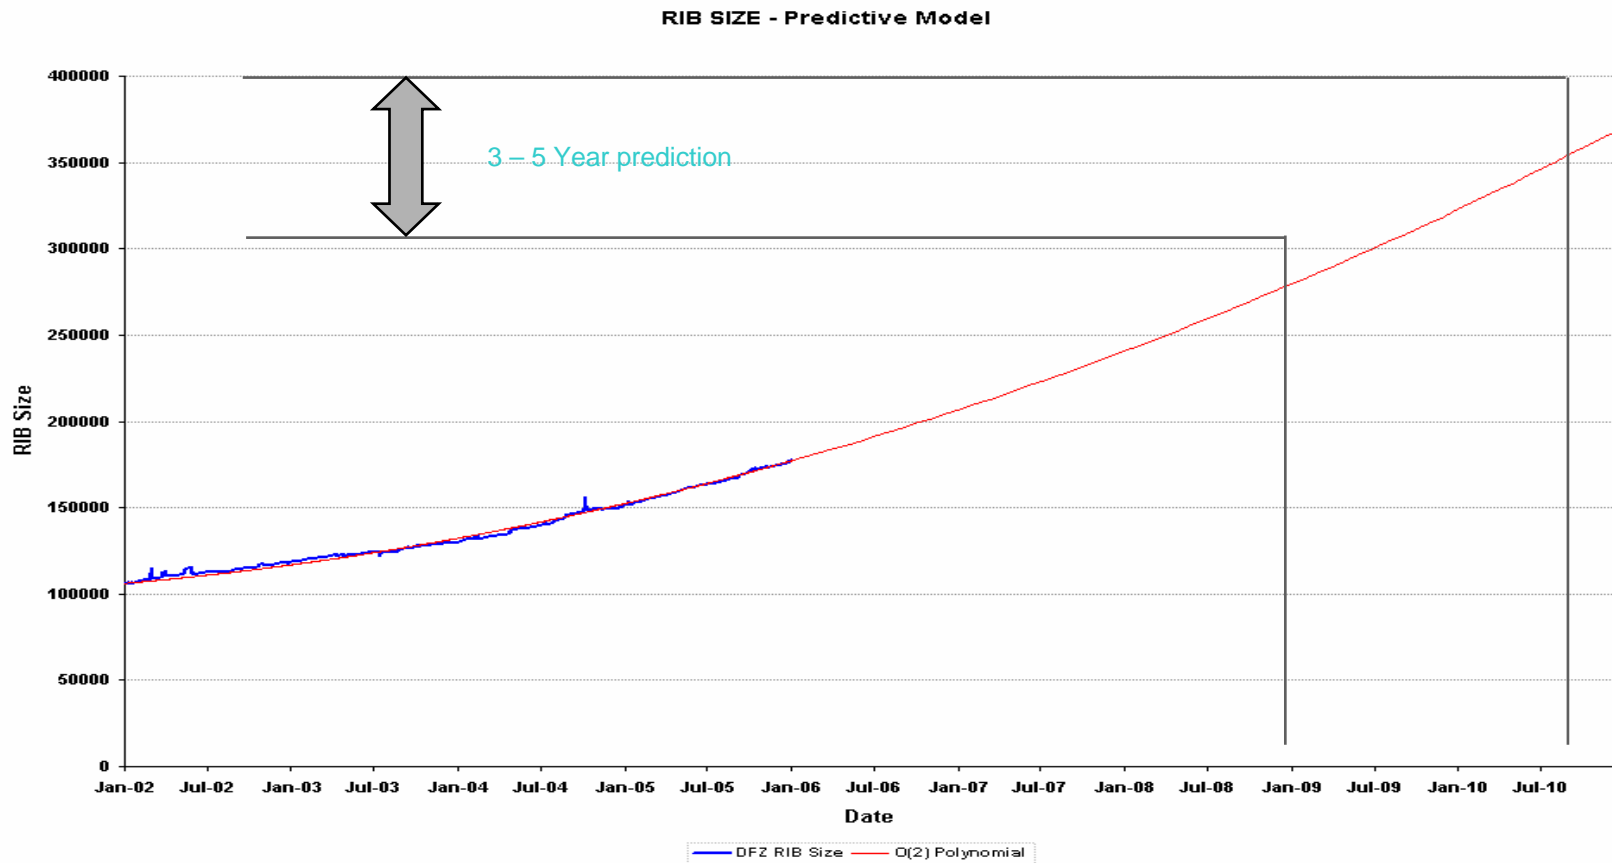

# 1<sup>st</sup> Order Differential

DFZ BGP Table Size - 1st Order Differential

# DFZ Model as an $O(2)$ Polynomial

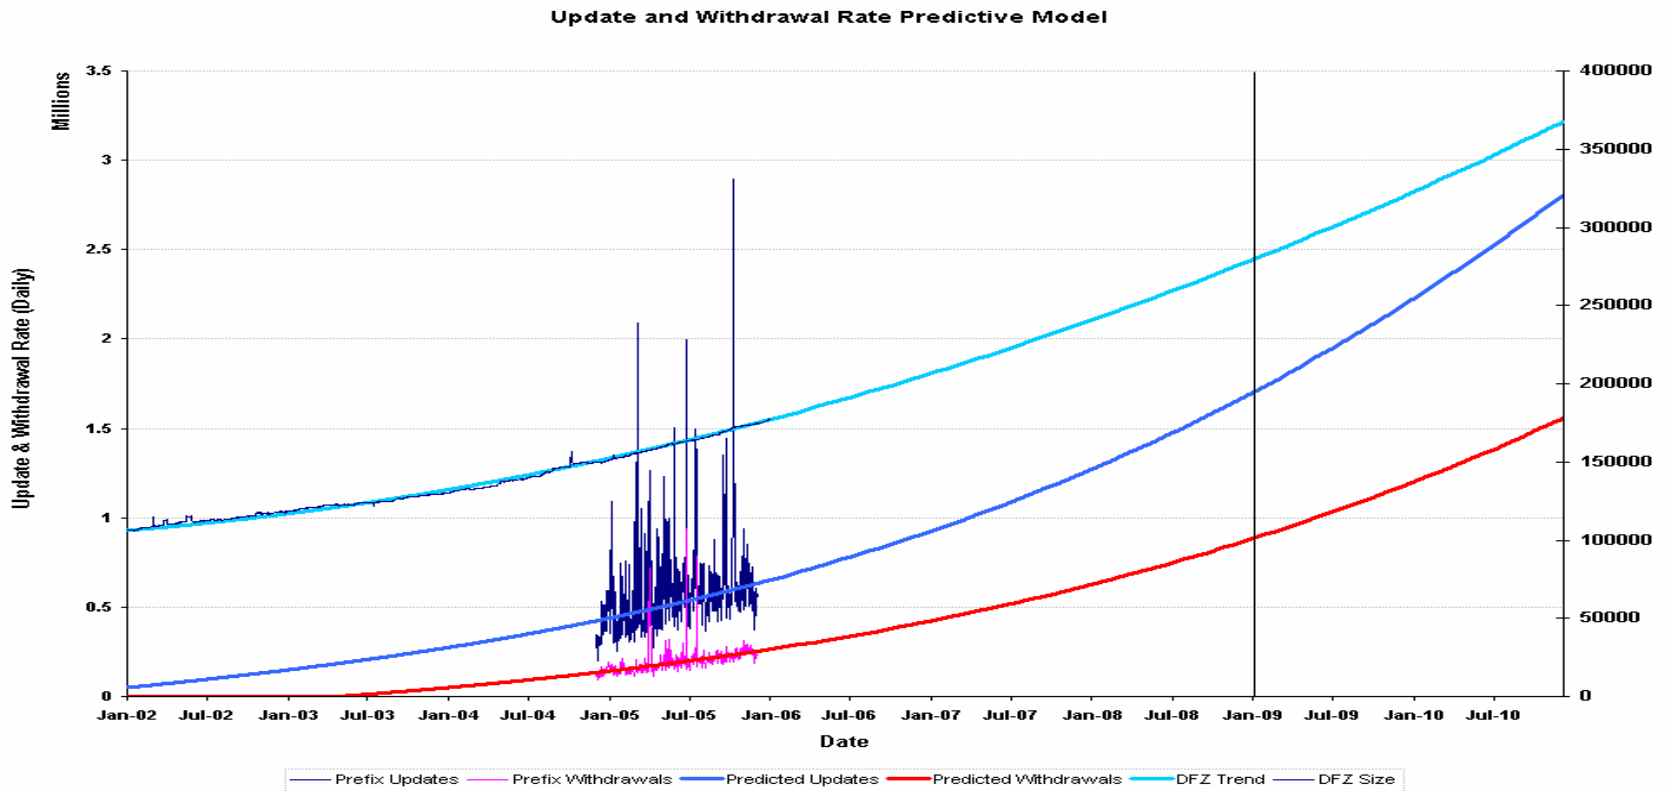

# Relative Update / Withdrawal Rates

Update and Withdrawal Rate / RIB Entry

# Update Rate Prediction

# 3-5 Year Predictions for the IPv4 DFZ

---

- Today (1/1/2006)
  - Table Size **176,000** prefixes
  - Update Rate 0.7M prefix updates / day
  - Withdrawal Rate 0.4M prefix withdrawals per day
- 3 Years (1/1/2009)
  - Table Size **275,000** prefixes
  - Update Rate 1.7M prefix updates / day
  - Withdrawal Rate 0.9M withdrawals per day
- 5 Years (1/1/2011)
  - Table Size **370,000** prefixes
  - Update Rate 2.8M prefix updates / day
  - Withdrawal Rate 1.6M withdrawals per day

# What's the uncertainty factor?

---

- What is the incremental processing load when we add cryptographic checks into BGP? Does this impact on the projections of BGP update traffic?
- Are these trends reliable? Are we seeing a uniform distribution of updates across all ASs and all Prefixes? Or is this a skewed heavy tail distribution where a small number of prefixes contribute to most of the BGP updates?

# Prefix Statistics for 2005

---

- Number of unique prefixes announced: 289,558
- Prefix Updates: 70,761,786
- Stable prefixes: 12,640
- Updated prefixes (year end): 162,039
- Withdrawn prefixes: 127,519

# Cumulative Distribution of Prefix Updates

# Active Prefixes

---

# So what's going on?

---

- It would appear that the BGP update rate is being strongly biased by a small number of origins with two forms of behaviour:
  - **Traffic Engineering** - consistent update rates sustained over weeks / months with a strong component of first hop change and persistent announce and withdrawal of more specifics
  - **Unstable configuration states** – a configuration which cannot stabilise and for a period of hours or days the update rate is extremely intense

# The Uncertainty Factor

---

- Given that the overwhelming majority of updates are being generated by a very small number of sources, the level of uncertainty in extrapolation of trend models of BGP update rates is extremely high
- This implies that the predictions of router capabilities in a 3 – 5 year interval is also extremely uncertain

# Next Steps...

---

- Can we identify and report on persistent BGP update generators?
- Generate per-Prefix and per-AS views and update stats summaries in an on-demand rolling 7 day window
- Correlation of path updates
- Example reports follow:

---

- Detail Report

# 209.82.241.0/24 15/3 – 17/3

# 61.0.0.0/8 15/3 – 17/3
